Vitamin D status in obese adolescents: the influence of physical activity. The aim of this study was to investigate the vitamin D status of obese adolescents and their relationship with body composition, physical activity and self-reported sun exposure. This was a cross-sectional, observational study in obese adolescents (n = 90), aged 14-18 years, submitted to clinical examination and testing of 25-hydroxyvitamin D (25(OH)D)

levels in the summer. Body composition was evaluated by Dual Energy X-ray Absorptiometry, and physical activity level and duration was estimated by an accelerometer. A questionnaire for self-reported sun exposure in the last 15 days was applied. Compared with the total sample, adolescents with obesity had lower body fat percentage, less daily physical activity and reported less time spent in sun exposure (p Q: What is the difference between arr.length and arr.length()?
