All of the tutorials on this site are written for absolute beginners. The free lessons are available at no cost. The paid tutorials are free to those who purchase the guide for that tutorial. An Introduction to Photoshop: Photoshop is probably the most powerful image editing software available today. It has even more features than other image editing software because the application is designed around layers. Most other software programs have a single, static image and don't support layers. Photoshop is a popular design program. That's probably because it was the first software that enabled designers to create and manipulate complicated graphic designs in a single tool. The most basic design tasks include typing text, resizing images and creating page layout. Newer features allow more complex design options. Some of the more popular features include the ability to edit multiple layers, apply filters and manipulate images such as the filter, blur and sharpen tools. Some more advanced functions include: Clipping Path Bitmap masking and selection tools Spot color support Tiling tools and filters Advanced vector editing tools The tools from the illustrator and illustrator vector programs are also available to Photoshop. You just have to install an additional program called Adobe Illustrator CS5 which comes with Photoshop. Photoshop is the industry standard for image manipulation software. It is used in every media outlet to manipulate images. A word of warning, however: even if you're a graphic designer or photographer, Photoshop is an industry standard software program that demands a lot of time and training to master. You may be wasting time and money by learning Photoshop if you don't have the time or resources to dedicate to learning the program and becoming proficient in it. You might be better off purchasing another image manipulation program such as PhotoFiltre, Pixelmator or Aperture. Most designers and photographers don't need Photoshop. In fact, an industry standard is that designers can create good looking graphics in a word-processing program such as Microsoft Word or QuarkXPress. Graphics must be vector images, however. Photoshop does a lousy job with vector images. PhotoShop: A Tutorial for Beginners: While Photoshop is the industry standard software for editing images, there are many smaller software programs that are as powerful or more powerful than it. There are plenty of tutorials online that teach Photoshop. Many of these tutorials are free or cost little money.

Q: Illustrator: Converting Path to Object? Is there a way to create an individual object from an existing path? A: Select the path and go to Object > Convert to > SVG. It will create a new SVG object. If you want to edit the path, select the path, then select Edit > Convert to > Path, and it will open the path properties dialog. A: To convert a path to a shape you can try the "Convert to Shape" function. In the dialog that appears, choose the shape you want to create and click on OK. You can also use the basic tools, like shapes to create objects. A: @andrei's suggestion works. Here is a method to do this without a dialog box. First, make sure to select the path layer and the 'folder' object in the layer palette. Then copy the path to the clipboard. Hit command+v and choose the 'shape builder' option. Change the shape type to shape (this will cause a dialog to appear.) Add the shape to the empty canvas. . -0.00036 Let $k = -27968 - -28503.66$. Q: How do I implement a simple if/else to different components of an app with only one reference? I have a simple Firebase project to learn both Javascript and React. I'd like to implement some basic toggles based on user input, but I'm having a lot of issues. I've looked for a basic guide to implementing a simple switch, but haven't found anything that goes beyond using a boolean variable. I've tried using an inline function, and wrapping the switch statement in an if/else. Neither are working, so I'd really appreciate if someone could point me in the right direction. I've added some code below to my index.js, and also a snippet of the code in question. Here's my Firebase database structure: And here's the code in question: `render() { const greeting = this.state.greeting; const { name } = this.props; return (Hello {name}! {greeting === 'hi'? 'Say "hi"' : 'Say "goodbye"' } this.setState({ greeting: 'goodbye' })>Hello there) } I was looking at how to do it here: const component = () => { const [data, setData] = useState(false) // switch statement to show/hide values function switchGreeting() { setData(data) } switch (data) { case false: return 'Hi' case 'hi': return 'Goodbye' case true: return 'Hi' default: return 'Hi' } return({switchGreeting()}) } I'd like to do something similar to`
