Tomtom One Bootloader 55136 Download =LINK=

the 900 uses armv6 cpus, while the go uses armv7 cpus. there are some structures in navit which are 32 bit only, while others are 64 bit only, so we need to do a bit of a conversion, changing where necessary. i have successfully compiled navit for the rpi. this works with the arm-none-linux-gnueabi-gdb toolchain included in the rpi, which is gcc (gcc -m32). i would like to try the same for the go, but i haven't yet found a way to compile it. note that this is currently just a test program. i have only tested if the application starts and if it runs in the background. you can't interact with it until the gui is initialized, which seems to take ages. if you don't want to compile everything by yourself (e.g. because you don't want to bother with installing all the software needed for compilation), you can start with the version compiled for the rpi. now back to the updates: you can download latest navit toolkit version from github. for this to be usable, you'll need to install some unofficial tools like binutils 2.25-1 (libbfd 2.25-4) or avitom, which you'll have to build yourself. you can now follow the wiki page on how to configure and update. in short: first, we have to configure the device for compilation: to do this, plug it into your computer. navit will notice it and ask you to select language. after that it will run an update and create a backup, then the procedure will guide you through the settings and if you already have the files we need there to flash them. there are two ways to compile a software: the "make" way, or the "apt-get" way. i like the second one better. but for both ways, please read the following article on how to update the tomtom: btw: makefile: for our kit, most of the files in this directory are already compiled and installed. just create a makefile, change the lines at line 8 & 9 to your kit (or just leave them as they are) and compile. now just follow the wiki page <https://github.com/g0th/avitom> .

**Download**

```
#!/bin/sh bash -x cat config.txt > & t=0 5ec8ef588b
```
